Installation of PyOR

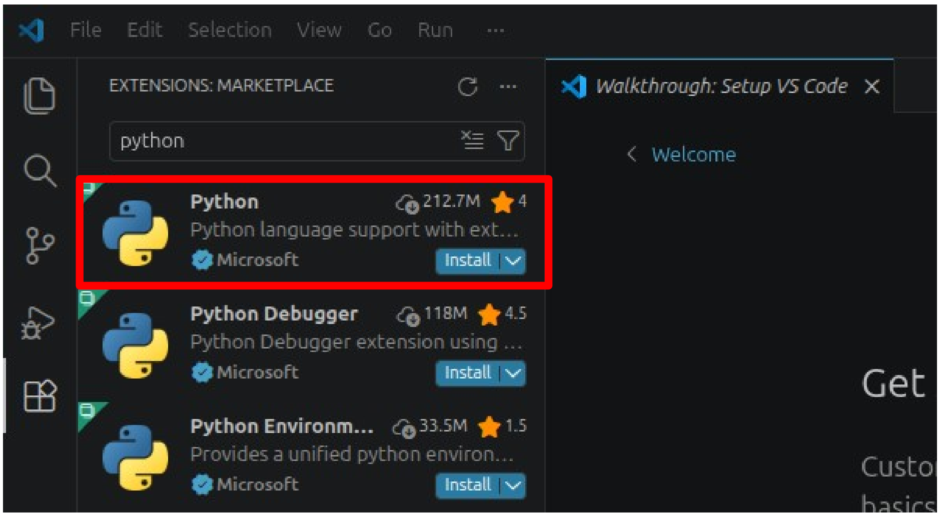
1. Install Anaconda or Miniconda
Download and install the Python Anaconda distribution (available for Windows, Mac, and Linux) from:
https://www.anaconda.com/download/success

Attention: If not interested to install Anaconda or miniconda then look into files:
Create_PyOR_Environment_in_Linux_(Ubuntu).pdf or
Create_PyOR_Environment_in_MacOS.pdf or
Create_PyOR_Environment_in_Windows.pdf
for creating **pyorv2** environment from scratch.

2. Install Visual Studio Code (VS Code)
Download Visual Studio Code from:
https://code.visualstudio.com/
For guidance on using Jupyter Notebooks in VS Code, refer to:
https://code.visualstudio.com/docs/datascience/jupyter-notebooks

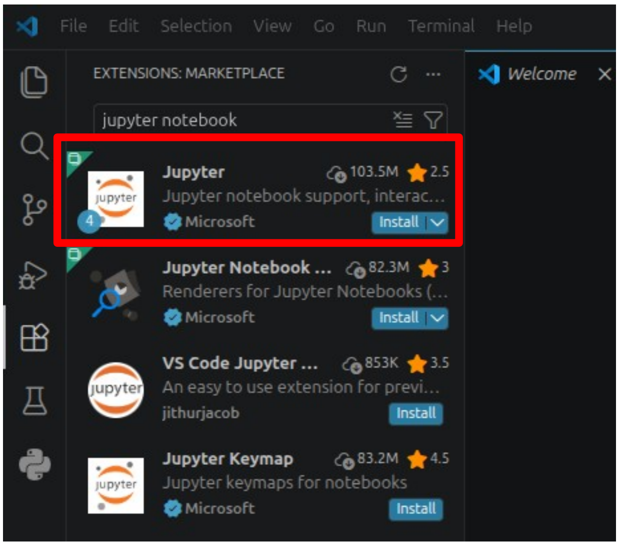
2.1 Install Python Extension

- Open VS Code
- Go to Extensions
- Install the **Python extension** provided by Microsoft



2.2 Install Jupyter Extension

- In the Extensions tab, search for **Jupyter**
- Install the **Jupyter extension** provided by Microsoft

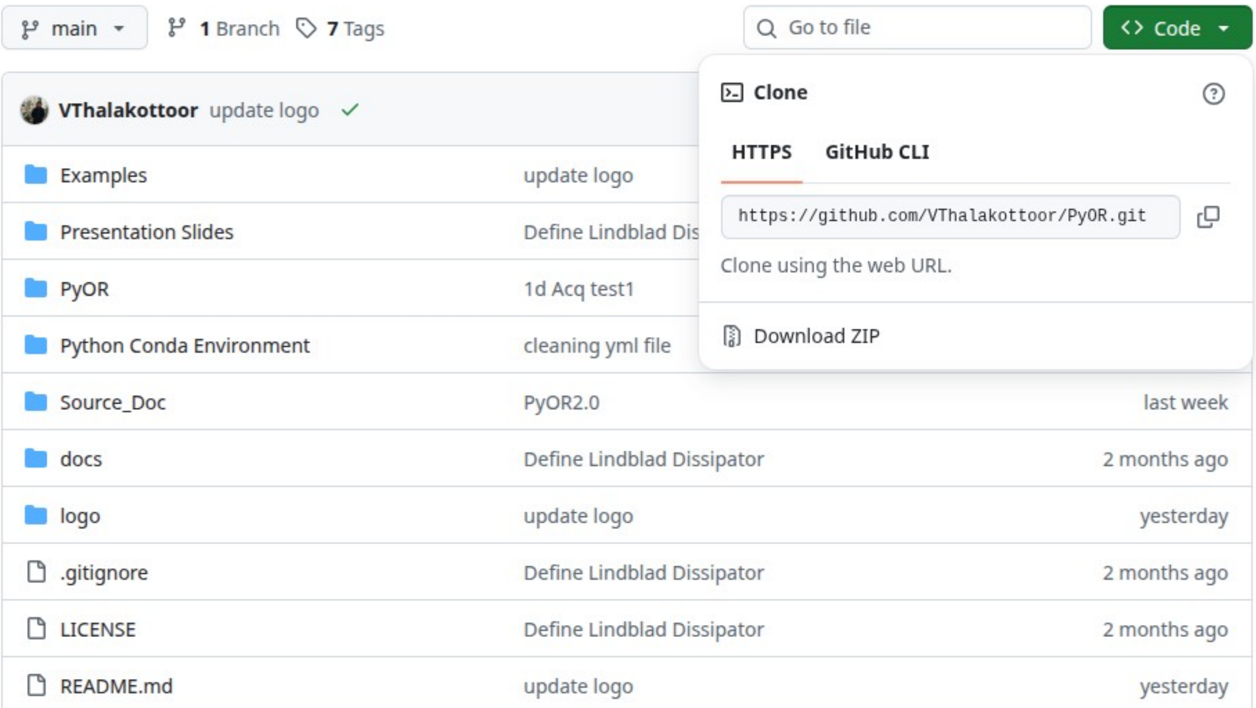


3. Download PyOR

Download PyOR from:
https://github.com/Vthalakottoor/PyOR

Steps:

- Click the **“Code”** button
- Select **“Download ZIP”**
- Locate the downloaded file (`PyOR-main.zip`) and extract it
- Open the extracted folder to view its contents



4. **Install the PyOR Environment (Anaconda or Miniconda)**

- In VS Code, click **Terminal → New Terminal**

- Navigate to the directory:
  `PyOR-main/Installation_Guide`
- Run the following command:

```
conda env create -f pyor_environment.yml
```

- If you have already created the `pyor` environment and need to update it, run:

```
conda env update -f pyor_environment.yml
```

- Activate the environment:

```
conda activate pyor
```

5. Create and Run a Jupyter Notebook

- Open the Command Palette in VS Code (`Ctrl + Shift + P`)
- Select **“Create: New Jupyter Notebook”**
- A new file (e.g., `Untitled-1.ipynb`) will open
- Define the path to the Python interpreter in the VS Code (`Ctrl + Shift + P`), select “**Python: Select Interpreter**”, and add path to the “/venvs/pyorv2/bin/python”
- Click **“Select Kernel”** and choose **“pyor” (Anaconda or Miniconda) or “pyorv2” (Created from scratch)**

You are now ready to start running simulations with PyOR.
